Application for Web Engineer at Acentura

Dear Acentura Team,

I'm applying for the Web Engineer role because I want to build a career around the work I enjoy most: exploring how a digital experience could look, feel and behave, then carrying that thinking through to a finished product. Your post's emphasis on UI/UX sensitivity, interaction design and creative problem-solving caught my attention.

My current role at Cogent Solutions has given me substantial responsibility and the opportunity to carry frontend work through to launch. I value that trust. It has also helped me understand what I want to pursue next: work where I can contribute to the experience itself, explore ideas with a team and refine them through implementation.

I want to think about the visual direction, the user's experience and the engineering together. I would bring hands-on frontend experience with React and Next.js, care for the details and a willingness to build and revise ideas until they work well. I enjoy taking an initial concept far enough that people can use it, question it and help make it better.

I value thoughtful feedback. I want colleagues who will question my choices, explain what I have missed and help me find a stronger solution. Working through user needs, technical constraints and different perspectives is part of the craft I want to get better at.

The connection between engineering and design in your post is what makes this opportunity interesting to me. I'd welcome a conversation about the projects your web team is building and how I could contribute.

Best regards,

Sandith Sithmaka Thenuwara
